Abstract

This document describes the user interface for SetPrimaryKeys module.

Introduction

Welcome to SetPrimaryKeys module. This is a module designed for setting up the primary keys of the datatables from the database. This module was primarily build for the box Ontology Mapping, otherwise, the primary keys are set in box Column.

User interface

There are displayed all the datatables from the database in the user view. For each datatable there is the name of the table and names of all the table columns. In the module, you can set primary key for each datatable. Primary key can consist of one or more columns, but it has to be unique in all the records of the table.
